## **Migraine Headaches | Johns Hopkins Medicine**

Migraine is a neurological condition that can cause multiple symptoms. It's frequently characterized by intense, debilitating headaches.

### **Everything You Want to Know About Migraine**

A migraine headache is unique among headaches because it includes symptoms other than pain. Nausea and vomiting, lightheadedness, and sensitivity to light.

12% of the population suffers from migraine, the 6th most disabling illness in the world. Migraine is an extraordinarily prevalent neurological disease.

It appears that migraine headaches may be caused in part by changes in the level of a body chemical called serotonin. Learn more about.

It could be a symptom of a subarachnoid hemorrhage a serious medical condition that requires immediate medical attention. This could include past head injury and sinus or dental problems.

Environmental and genetic [3]. A migraine usually lasts from four to 72 hours. The pain can range from mild to severe, and they usually occur on both sides of your head. The treatment of migraine symptoms focuses on avoiding headaches, controlling symptoms, and taking medicine.

Treatment can also help make the migraines you have less severe. New York, N.Y. a number of headache/migraine treatments are available to reduce the symptoms and prevent further attacks. Another aspect that is being studied is that migraine headaches go along with a spreading pattern of electrical activity in the brain.
