Leonhard Euler was the most prolific mathematician of all time. So, a multigraph is like a graph except that more than one edge can be incident to the same pair of vertices. The graphs in Figs. Evolving in such an environment, this book might best be described as a collection of puzzles. Let $A(G)$ and $\delta(G)$ be the largest and smallest of the vertex degrees of G , respectively. Let's see if we can figure out what is going on graph theoretically as boxes are moved down in F ultimately to produce F_n . It follows from the induction hypothesis that $G' - v$ is equivalent to H . Draw four dots on a sheet of paper. If the only vertex common to Q and C is u , then see Fig. Without these cookies, we can't provide services to you.
